

V6 e300: paired BN and gradient diagnosis

Same 16 augmented diagnostic batches; global64 assembled from two ordinary local32 forwards. Gray lines pair the same batch; black diamonds are medians. Weighted FP32 preclip VJPs include all model parameters (classifier included). Fixed-ancestor and ST losses have identical forward hinges. Ancestor agreement holds eval triplets and Gumbel noise fixed; a resampling-noise baseline is not shown. This is neither a rolling BN trajectory nor multi-seed evidence.
